Question 1. What is difference b/w DF & and BFS with applications of both the algorithm.

Ans

BPS

- 1) It stands for Breadth. First Search.
- 2) It uses. Queue Data Struct
- 3) It is more suitable por Searching Vertices which are Close to given source.
- 4) It considers all neighbours first of and therefore not suitable for decision. making trees used in games and puzzles.
 - 5) Here siblings are visited before the offsprings
 - 6) Backtracking is possible.

DFS

- 1) It stands for Depth.
- 2) It will stack data structure.
- 3) It is more suitable when there ar solutions among from sources.
- Jet is more suitable for.

 game or puzzle problems

 me make a decision then

 explore all parts through

 this decision and if

 decision hads to win

 situation me stop.
 - 5) Here offeprings are velited before. Siblings.
- 6) It is a recursive algorithm
 that was backtracking.

7) It requires more memory 7) It requires less memory.

Applications:

BFS -> Bipartite graph and shortest path, per to per meturerking crawlers search engine of and GPS navigation eyetem.

DFS -> Acyclic graph, topological order, scheduling. problems, sudoku puggles.

BFS and DFS and ruly?

for implementing BFS we used queue data structure, for junding shortest path b/w any mode. He duse queue because things don't have to be processed.

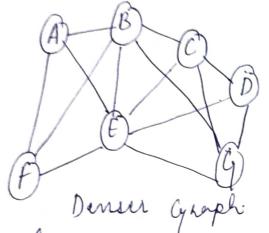

Immediately, but have to be processed in FIFD ander wike BFS. BFS searches for modes level wike, i.e. if searches modes were their distance from root (sou -ree). For this queue is letter to use in BFS.

for implementing DFs are used a stack data structure as It transverse a graph in depthward. It metion and uses stack to semember to get the next vertex to start a search, when a dead end occurs in any iteration.

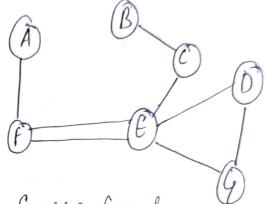

Ques-3: what do you mean by sparse and dense graph? which representation of graph 11 letter for sparse and dense graph?

→ Dense graph is a graph in which no of edges is close to maximal no of edges.

Space graph is graph in which no of edges is very less

Denser Graph: (many edges 6/10 modes)

Sporse Graph C. Few eages b/w modes)

→ for sparee graph, it is preferred to use Adjacency.

-> For denser graph, it is preferred to use Adjacuncy Make's

Ques-4 How can you detect cycle in a graph using BFs and DFs?

Ans for detecting cycle in a graph ming BFs as me need to me. Kahn's Algorithm for topological certing—
The steps involved are—

1) compute in degree (no. of incoming edges) for each of vertex present in graph and intialize count of visited modes as 0.

2) Pick all vertices with in degree as 0 and add them.

- 3) Kemone a vertex from queue and then - increment count by visited modes by I

 - → bereases in degree by s for all is neighbouring nodes → ty in-degree of neighbouring. modes is reduced to zero then add to queue.

4) Repeat step (3) until queue's is empty.

- 5) If count of visited modes is not equal to no. of nodes Im graph, has cycle, otherwise not.
- > For detecting cycle on graph ming DFS me need to do parloming:

DFS por a connected graph produces a tree . There is opcie in graph if there is a lack eagle present in. the graph. A back edge its an edge that is from a node to itself (self loop) or one of its another in the tree produced by DFS. For a disconnected graph, get DFS jorent as output. To detect cycle, check for a cycle in.
individual tracky checking back eagles. To detect a back
coge keep track of vertices currently in recursion drack per DFS toaversal. If a vertex is reached that is already in securion stack, then there is a cycle.

Question 5. What do you mean by disjoint set data Structure? Explain three operation along with earn example which can be performed on disjoint lets?

A disjoint set in a data structure that keeps track of set of elements partitioned into several disjoint into subsets. In other words a disjoint set is a group of sets where no item can be in more them one set.

Three operations are -

a) find - com be impremented by recurring transversion -ng the parent array until true hit a mode who

```
is parent to itself
      Int find (int ?)
          y (parent si]== i)
             1 return i
           return find (parent (iT)
Union - It takes 2 elements as input And find
representatives of this sets using the find operation.
and finally puts either one of the trees under rose
of other tree, effectively merging the trees and sels.
Cx - Vold union (int l, int f)
          Ent Irep = This . Find (i);
           Int jrep = This. find (j);
           this. parent linep ] = julp;
 union By Rank - me need. a new array rank []
```

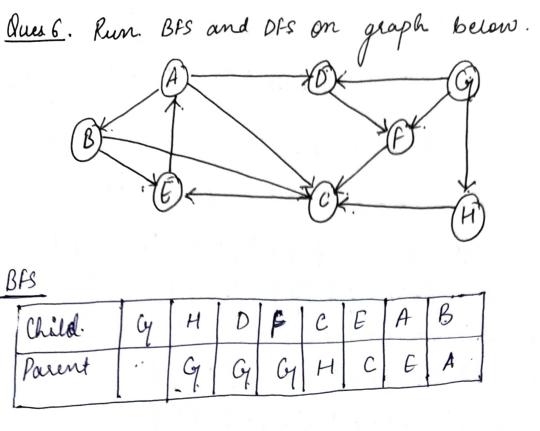

union By Rank - we need a new array rank []
Size of array same as parent array. If it is
representative of set, rank [i] is height of tree,
we used to minimize height of tree. If we as
limiting tow trees, we coul them left and right
then it are depends on rank of left and right.

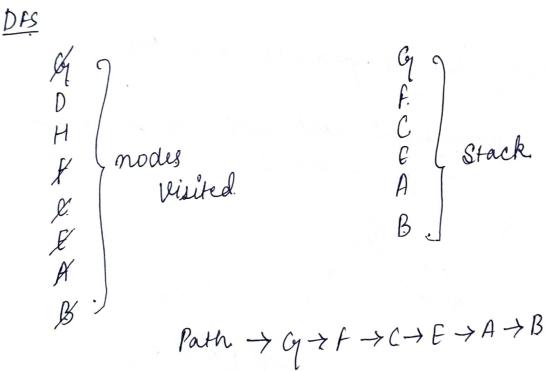

- · If rank of left is less than right then it's best to more left under right and vice versa.
- If rank are equal, rank of result will always be one greater man rank of trees.

Ex > void union (in) i, int]) Int trep = this. Find (1); int jrep = this. Find (3); if (irep == jup) seturn; irank = Rank [irep]; jeank = Rank [frep]; if (irank < frank) this parent [irep]=frep; elle if (jrank < irank) this. parent [jrep] = irep; Else.

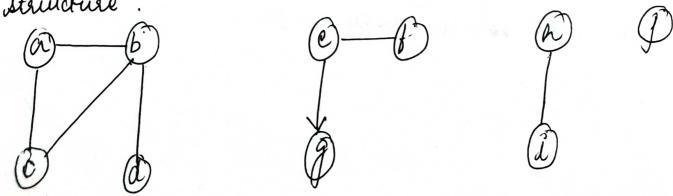

His parent [irep] = jrep;

Rank [jrep] ++;

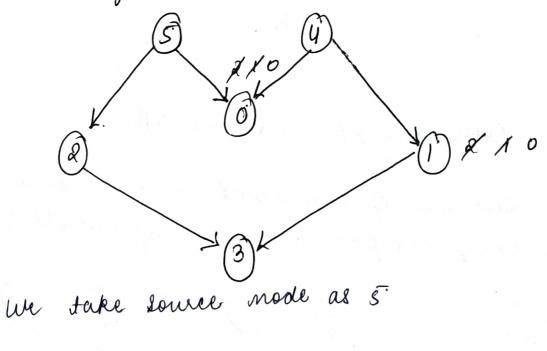

Jues 7. find out no. of connected components and Vertices in each component wing disjoint let data. Structure.

V = { a3, { b3, {c3, {d1, {e3, {t3, {g3, {i3, {i3, {j1}}}} E = {a, b} {a, c} {b, c} {b, d} {e, f} {e, g} {h, i} {ij} (a, b){a,b,c}{d} fed fed {t} ff fg } ful \$13 fil (a,c)ga, b, c3 gd 3 {e3 {t3 {93 {n3 ?13 {13 (b, c){a, b, c, d} {e3 f f g {g ? {h? {i3 f j} (b,d){a,b,c,d} {e,t} {93 fag {13 {13 } (e,f)fa, b, c, d] {e, t, g3 {n3 {i3 {i}} (e,g){a,b,c,d}{e,t,9}{h,i3}{f} (h,i)

No. of connected components = 3 - Ans

Ques 8. Apply topological earl and DFS on geaph howing vertices from 0 to 5

>+9:5/4; pop 5 and decreament in degree of 1+ by 1. Applying Topological Sort -> 9: 4/2; Pap 4 and DFS (5)X decrement in degree and push o DFS (0) -> 9:2/0; pop and deere DFS(4) ment in degree and. LDFS(2) push 3 Not possible. -> 9: 0/3 Papo, Pap3 DFS (3) Push 1 DFS(1). 9:1; pop1. Answer - 5-42031 DFS Topological sert $4 \rightarrow 5 \rightarrow 2 \rightarrow 3 \rightarrow 1 \rightarrow 0$

Ques 9 theap dorta structure can be used to implement priority queue Name you graph algorithm where you need to use priority queue and may?

Ans. Yes, heap idata structure can be used to implement priority queue. It will take O(log N) time to insert and delete each element in priority queue. Based on heap structure, priority queue has two type max priority queue based on max heap and min. priority queue based on min-heap, theap provides better performance comparitively to array and holo

The graph like Olfkstra's shortest path algorithm Prim's Minimum Spanning Tree uses Priority Queue.

- Dijketra's Algorithme: When graph is stored in.

 form of adjacency list or natrix priority queue.

 is used to extract minimum expliciently when.

 implementing the algorithm.
- -> Prim's Algorithm: It is used to store keys of. nodes and extract minimum key made at every step.

Questo Differentiate b/w Min heap and Max heap.

Ans. Min heap

- 1) In min-heap, key.

 present at root mode
 must be less than or.
- 2) The minimum key element is present at the root
- 3) It uses ascending priority
- 4) The smallest element how priority while construction. of min heap
- 5) The smallest element is the first to be popped from the heap

Max heap

- 1) The key present at root node must be greated than or equal to among keys present at all of its children.
- 2) The max key element is present at the root.
- 3) It uses descending priority.
- 4) The largest element has priority white const -ruction of Max heap.
- 5) The largest element is the first to be papped the heap.
